Penilaian risiko sanitasi lingkungan atau yang juga dikenal dengan *Environmental Health Risk Assessment* (EHRA) adalah studi untuk memahami kondisi fasilitas sanitasi dan perilaku-perilaku yang berisiko pada kesehatan masyarakat. Kondisi sanitasi di desa Tanjung Durian Kabupaten Oku Selatan yang kurang mendapat perhatian salah satunya disebabkan oleh lemahnya perencanaan pembangunan sanitasi, tidak terpadu, salah sasaran, tidak sesuai kebutuhan, tidak berkelanjutan dan kurang kesadaran masyarakat terhadap sarana sanitasi yang baik dan perilaku hidup bersih dan sehat (PHBS) sehingga berakibat pada buruk kondisi lingkungan permukiman. Hasil analisis EHRA dalam bentuk IRS penting dilakukan mengingat masih rendahnya angka sanitasi total di Desa Tanjung Durian Kabupaten Ogan Komering Ulu Selatan.

Environmental sanitation risk assessment or also known as Environmental Health Risk Assessment (EHRA) is a study to understand the condition of sanitation facilities and behaviors that pose risks to public health. Sanitation conditions in Tanjung Durian village, South Oku Regency, which receive little attention are caused by weak sanitation development planning, not integrated, wrongly targeted, not according to needs, not sustainable and lack of public awareness of good sanitation facilities and clean and healthy living behavior. (PHBS) which results in poor residential environmental conditions. The results of the EHRA analysis in the form of IRS are important considering the low total sanitation figures in Tanjung Durian Village, South Ogan Komering Ulu Regency.
